

Email Digest — Launch Guide

StallionTracker · prepared June 2026 · status: built and previewed, not yet sending

What is already built

- Combined per-org daily email (**--combined --org "Org Name"**): merged Stakes Ahead across the org's stallions (each runner labeled with its sire), then a section per stallion with today's entries, tomorrow's entries, yesterday's results (no claiming races), and headline news from the last 2 days. Quiet stallions are omitted; quiet orgs get no email.
- Per-stallion email also available (default mode, used for one-off sends).
- Org theming from the database: primary/secondary colors, silks image in the header, accent badges. Themes auto-adjust for light colors.
- Data-driven subject lines, e.g. "SOLIS/LITT: a winner yesterday, 9 stakes entries ahead incl. G3".
- All items hyperlink to Equibase (profiles, entries, charts) and news articles; responsive layout verified at iPhone width; output compacted to stay under Gmail's ~102KB clip limit.

Preview commands (safe — nothing sends)

```
cd ~/Desktop/Claude/StallionTracker/digest
python3 generate_digest.py --preview --combined --org "Solis/Litt" > /tmp/digest.html
open /tmp/digest.html
# per-stallion variant:
python3 generate_digest.py --preview --stallion "Constitution" --org "Repole Stable" > /tmp/d.html
# flags: --news-days N (default 2), --dry-run (shows recipients + subject)
```

Step 1 — Verify a sending domain in Resend (you, ~15 min)

- Log in at resend.com → Domains → Add Domain → **solislitt.com** (or mail.solislitt.com).
- Resend shows 3 DNS records (DKIM + SPF). Add them where solislitt.com's DNS is managed. Verification usually completes within the hour.
- Confirm an API key exists for this Resend account, and add it to GitHub → repo Settings → Secrets → Actions as **RESEND_API_KEY** (next to the Supabase secrets).
- Resend free tier: 3,000 emails/month, 100/day. Expected volume is ~6/day (one per org) — comfortably free.

Step 2 — Recipients per org (Claude builds)

Migration adding **digest_recipients TEXT[]** to the organizations table, plus an editor in Admin → Organizations. Recipients do not need app logins. Orgs with an empty list are skipped. Decision made: one combined email per org per day, not per stallion.

Step 3 — From-address (Claude builds)

Change the sender in `digest/generate_digest.py` from the placeholder **digest@stalliontracker.com** to **digest@solislitt.com** (must match the domain verified in Step 1).

Step 4 — Daily cron (Claude builds)

New workflow [.github/workflows/daily-digest.yml](#) (~10:00 ET daily, after overnight scrapers): loop orgs that have recipients → generate --combined → send via Resend → log to the existing `digest_log` table. Same free GitHub Actions pattern as the news feed.

Step 5 — Test ladder before real recipients

- First send goes only to your own email (set `DIGEST_RECIPIENTS` env var). Check Gmail and Apple Mail on the phone; click every link.
- Then enable Solis/Litt's real recipient list for a few days.
- Then add the other orgs' lists as confidence grows.

Decisions already made (so future sessions don't relitigate)

- No claiming races (CLM/MCL) in any digest.
- News window: last 2 days; headline-flagged articles and admin-posted links only (no passing mentions).
- Earnings hidden when the USD total is zero (European stallions earn EUR/GBP; the YTD view is currency-safe and USD-only).
- US track names proper-cased ("Santa Anita Park"); international names pass through untouched.
- Stakes Ahead window: 7 days. Subject lines cap at two facts.
- Stallion conformation photos: deferred (banner under header when photos are sourced; never a small square next to the silks).

Resume work by telling Claude: "set up the email digest sending" — Steps 2–4 are buildable immediately; only Step 1 needs your DNS access.
